

INSTRUCTIONS

- Wash with antibacterial soap and water and pat dry with a clean, dry cloth.
- Do not resume any method of eyebrow hair removal or coloration for at least two weeks.
- Avoid eyebrow tinting until procedure is fully healed.
- Apply ice packs as necessary to prevent or reduce swelling.
- When the area starts to flake, leave it. Do not pick, peel or pull on the skin.
- Apply a thin coat of Aquaphor® or white petroleum (such as Vaseline®) or fragrance free lotion to the area twice a day for 3-4 days, before showering and after cleansing.
- Sleep on a clean pillowcase
- Always check healing products for ingredients to which you may be allergic to before applying.
- Avoid sweating such as from vigorous exercise for 24 hours.
- For at least one week post-procedure or until healing is complete (whichever is longer):
- Keep your hands clean and avoid touching the affected area(s).
 - Do not scrub or pick treated areas.
 - Do not use peroxide or Neosporin on treated areas.
 - Do not expose area to direct sun or to tanning beds.
 - Avoid exposing the area excessive moisture or humidity, such as: facials, swimming, whirlpools (hot tubs), saunas, steam rooms, and steamy showers
- Avoid Retin-A, moisturizers, glycolic acids, exfoliants and anti-aging products at all times (not just during healing) on all Micro Pigmented areas. These can cause pigments to fade and lighten prematurely.
- Avoid tanning beds, sun, chlorine spas and pools, soap and chemicals (including skin cleansers, makeup removers, alpha hydroxyl creams, and tooth whitening toothpaste) near the treated area until healed.
- Pigments will slowly fade over time according to one's metabolism, skin type, sun exposure, medication, facial surgery, and smoking. Schedule maintenance visits as needed to keep it looking fresh.
- Periodic touch ups will ensure longer lasting results.

MICRO PIGMENTATION

Micro Pigmentation (semi-permanent makeup) procedures are affected by the "canvas" (your skin) that they are performed on. Lifestyle, medications, smoking, metabolism, facial surgery and other procedures, and age of skin all contribute to fading. The initial application is always applied conservatively because every person's skin is different and the final color can only be precisely determined and adjusted during a follow-up appointment after the initial application has fully healed. Because of this, the Micro Pigmentation process is not complete after the initial procedure. In all cases, a follow-up appointment is required approximately 30 days after your initial application to fine tune and ensure the best result.

AFTER CARE

Though rare, infection is possible. If you see signs of infection such as persistent increased redness or swelling, fever, drainage, or oozing, contact your doctor immediately.

EYEBROW MICRO PIGMENTATION

HEALING SCHEDULE

MICRO PIGMENTATION

If you've never had Micro Pigmentation before, there are a lot of unknowns. One of the most common questions we're asked is what to expect during the healing process. While every person is different and some heal more quickly or slowly than others, here's generally what to expect.

TEMPORARY SIDE EFFECTS

Temporary side effects from Micro Pigmentation include but are not limited to: redness, swelling, puffiness, bruising, dry patches and tenderness.

WHAT TO EXPECT:

You should expect to lose approximately 1/3 of the initial color during the healing process. We have selected the optimal pigments for you with this in mind. In approximately six days it may appear too light. After about 10 days, the color will show more. It will appear softer when completely healed.

HEALING SCHEDULE

Day 1 and Day 2

The eyebrows are approximately 20-25% bolder and darker in width than they will be when healed. Expect light to moderate swelling and redness. The skin's redness causes the color of the pigment to appear darker. There is some swelling, although difficult to actually see due to the thickness of the skin in the eyebrow area. This will subside. Exfoliation, which begins in a few days, will cause the excess pigment surrounding the eyebrow to flake away and a more narrow appearance will result. New skin will heal over the pigmented area and result in a softer appearance of your eyebrows. Don't be concerned that your eyebrows initially appear darker and heavier in size than you desire. This is all part of the process

Day 3

Eyebrows start to itch and will appear a bit thicker in texture. Exfoliation begins

Day 4

The skin begins to flake, peeling from the outside edges first.

Day 5

Color finishes flaking off and appears softer and grayer for a few days until color clarifies.

Day 6

The color has lightened from its initial overly-dark appearance. For the next few days, the color may now be lighter than what the final color will be.

Day 10

The final color begins to stabilize and show through. The color will continue to soften as the healing process completes.

I UNDERSTAND AND ACCEPT THAT FAILURE TO FOLLOW THE POST-PROCEDURE INSTRUCTIONS ABOVE MAY RESULT IN A LOSS OR DISCOLORATION OF PIGMENT RESULTING IN A NEED FOR MORE FREQUENT TOUCHUPS.
